

Data sheet

Solenoid valve

Type EVR 2 - EVR 40 Version 2

EVR is a direct or servo operated solenoid valve suitable for liquid, suction, and hot gas lines with most refrigerants, including flammable refrigerants. EVR valves and coils are sold separately.

**Features**

- Complete range of solenoid valves for refrigeration, freezing and air conditioning plant
- Supplied in versions normally closed (NC) and normally open (NO) with de-energized coil
- Wide choice of coils for AC and DC
- Suitable for most refrigerants, including flammable refrigerants
- Designed for media temperatures up to 221 °F
- Flare connections up to $\frac{5}{8}$ in
- Solder connections up to $2\frac{1}{8}$ in
- Extended ends on solder versions make the installation easy, eliminating the need to dismantle the valve when soldering in
- Available in flare, solder and flange connection versions

Approvals

- Pressure Equipment Directive (PED) 2014/68/EU
- Low Voltage Directive (LVD) 2014/35/EU
- UL429 General Purpose Valve
- EAC
- UA
- ATEX zone 2
- CQC
- RoHS II
- For Marine approvals: Contact Danfoss for latest updates

Technical data

Refrigerants

R22/R407C, R134a, R404A/R507, R410A, R407A, R32, R290, R600, R600a, R1234yf, R1234ze, R407F, R125, R152A, R448A, R449A, R452A, and R450A. For a complete list of approved refrigerants, visit www.products.danfoss.com and search for individual code numbers, where refrigerants are listed as part of technical data.

Special note for R152A, R32, R290, R600, R600a, R1234yf, and R1234ze:

This product is validated in accordance to ATEX, ISO 5149, IEC 60335, and UL. Ignition risk is evaluated in accordance to ISO 5149 and IEC 60335. See safety note at the bottom of this page.

Media temperature

-40 – 221 °F

Max. 266 °F during defrosting

Ambient temperature and enclosure for coil

See separate data sheet for solenoid and ATEX coils.

Max. working pressure

EVR solder and flare connections: 655 psi.

EVR flange connections: 460 psi.

Max. working pressure in bar in relation to media temperature in °F.

Capacity

See extended capacity tables later in this data sheet.

Type	Opening differential pressure with standard coil Δp [psi]

EVR 40 NC	2.9	450	246

The EVR 2 - EVR 22 with solder connections and without manual stem can be applied on systems with R152A, R32, R290, R600, R600a, R1234yf, and R1234ze as the working fluid.

For countries where safety standards are not an indispensable part of the safety system Danfoss recommends the installer gets a third party approval of any system containing flammable refrigerant.

Note: please follow specific selection criteria stated in the datasheet for these particular refrigerants.

Data sheet | Solenoid valve, types EVR 2 - EVR 40 Version 2

Rated capacity [TR] For other refrigerants, refer to Coolselector®2

Capacities are based on:

Pressure drop across valve: 3.00 psi
Liquid temperature: 100.0 °F
Subcooling: 10.0 °F
Evaporating temperature: 40.0 °F
Superheat: 0 °F

Capacities are based on:

Pressure drop across valve: 1.00 psi
EVR 25, EVR 32, EVR 40: 2.00 psi
Liquid temperature: 100.0 °F
Subcooling: 10.0 °F
Evaporating temperature: 40.0 °F
Superheat: 0 °F

Capacities are based on:

Pressure drop across valve: 3.00 psi
Condensing temperature: 100.0 °F
Subcooling: 10.0 °F
Hot gas temperature = $t_c \pm 40.0$ °F
Evaporating temperature: 40.0 °F
Superheat: 0 °F

Technical data

Design
In accordance with VDE 0580

Power supply
Direct current (DC)

Permissible voltage variation
±10%

Power consumption
16-20 W

Insulation of coil wire
Class H according to IEC 85

Connection
Terminal box

Enclosure, IEC 529
IP 67 NEMA 6

Ambient temperature
-40 °F – 122 °F (-40 °C – 50 °C)

Function

EVR solenoid valves are designed on two different principles:

1. Direct operation
2. Servo operation

See *Design and material* drawings for additional details on the following pages

1. Direct operation (NC)

EVR 2 – EVR 3 are direct operated. The valves open directly for full flow when the armature (3) moves up into the magnetic field of the coil.

This means that the valves operate with a minimum differential pressure of 0 bar.

The seat plate is fitted directly on the armature (3).

Inlet pressure acts from above on the armature and the valve plate. Thus, the inlet pressure and spring force act to close the valve when there is no current in the coil.

2. Servo operation (NC)

EVR 4 – EVR 22 are servo operated with a "floating" diaphragm (4). The pilot orifice of stainless steel is placed in the center of the diaphragm. The seat plate is fitted directly to the armature (3). When there is no current in the coil, the main orifice and pilot orifice are closed. The pilot orifice and main orifice are held closed by the armature spring force and the differential pressure between inlet and outlet sides.

When current is applied to the coil, the armature is drawn up into the magnetic field and opens the pilot orifice. This relieves the pressure above the diaphragm, i.e. the space above the diaphragm becomes connected to the outlet side of the valve.

The differential pressure between inlet and outlet sides then presses the diaphragm away from the main orifice and opens it for full flow. Therefore a certain minimum differential pressure is necessary to open the valve and keep it open. For EVR 4 – EVR 22 valves the minimum differential pressure for safe operation is 0.03 bar.

When the current is switched off, the pilot orifice is closed. Via the equalization holes in the diaphragm, the pressure above the diaphragm rises to the same value as the inlet pressure and the diaphragm closes the main orifice.

EVR 25, EVR 32 and EVR 40 are servo operated piston valves. The servo piston (16) with sealing face closes against the valve seat by means of the differential pressure between inlet and outlet side of the valve and the force of the compression spring. When the coil is switched on, the pilot orifice opens. This relieves the pressure on the piston spring side of the valve. The differential pressure will then open the valve. The minimum differential pressure for safe operation is 0.2 bar.

EVR (NO) has the opposite function to EVR (NC), i.e. it is open with de-energized coil.

EVR (NO) is available with servo operation only.

3. Bi-flow operation with EVRC

EVRC is a servo operated solenoid valve with a special diaphragm with built-in non-return valve. The valve is for use in liquid lines in refrigeration plants.

EVRC allows flow in both directions and can be used in liquid lines in refrigeration plants with hot gas or gas defrost.

During the refrigeration period EVRC works as a normal solenoid valve, while during defrost it allows the condensed liquid to return to the liquid manifold.

During the defrosting period the coil for EVRC must be energized.

4. Manual stem operation for EVR 6 - EVR 25 NC

EVR 6 - EVR 25 NC are available with optional manual stem operation to manually force the NC valve open when the coil is de-energized.

The protective cap should be removed and the manual stem (12) should be rotated until the valve is fully open. It takes approx. 6 cycles from fully closed, to reach the fully open position.

After manual operation is completed, the valve should manually be closed again and the protective cap mounted.

Alternatively, all EVR NC and NO valves can be manually operated by removing the coil and force the valve open or closed by using a solenoid valve tester (permanent magnet) code no. 018F0091.

Capacities are based on:
 Liquid temperature: 100.0 °F
 Subcooling: 10.0 °F
 Evaporating temperature:
 40.0 °F
 Superheat: 0 °F

Metric conversions
 1 psi = 0.07 bar
 $\frac{5}{9} (t_1 \text{ °F} - 32) = t_2 \text{ °C}$
 1 TR = 3.5 kW

Correction factors

When sizing valves, the plant capacity must be multiplied by a correction factor depending on liquid temperature t_l ahead of valve/evaporator.

When the corrected capacity is known, the selection can be made from the table.

Correction factors based on liquid temperature t_l

t_l [°F]	80	90	100	110	120
Factor	1.10	1.05	1.00	0.95	0.90

The table values refer to the evaporator capacity and are given as a function of evaporating temperature t_e and pressure drop Δp across valve.

Capacities are based on:
Liquid temperature $t_l = 100$ °F
Subcooling = 0 °F
Superheat = 7 °F

Metric conversions
1 psi = 0.07 bar
 $\frac{5}{9} (t_1 \text{ °F} - 32) = t_2 \text{ °C}$
1 TR = 3.5 kW

Correction factors

When liquid temperature t_l ahead of the expansion valve is other than 100 °F, adjust the table capacities by multiplying them by the appropriate correction factor found in the following table.

Correction factors based on liquid temperature t_l

t_l [°F]	80	90	100	110	120
Factor	1.10	1.05	1.00	0.95	0.90

Data sheet | Solenoid valve, types EVR 2 - EVR 40 Version 2

Extended capacity

Suction

(continued)

The table values refer to the evaporator capacity and are given as a function of evaporating temperature t_e and pressure drop Δp across valve.

Capacities are based on:

Liquid temperature $t_l = 100^\circ\text{F}$

Subcooling = 0°F

Superheat = 7°F

Metric conversions

1 psi = 0.07 bar

$\frac{5}{9}(t_1 - 32) = t_2$ °C

1 TR = 3.5 kW

The table values refer to the evaporator capacity and are given as a function of evaporating temperature t_e and pressure drop Δp across valve.

Capacities are based on:
Liquid temperature t_l = 100 °F
Subcooling = 0 °F
Superheat = 7 °F

Metric conversions
1 psi = 0.07 bar
 $5/9 (t_1 \text{ °F} - 32) = t_2 \text{ °C}$
1 TR = 3.5 kW

Correction factors

When liquid temperature t_l ahead of the expansion valve is other than 100 °F, adjust the table capacities by multiplying them by the appropriate correction factor found in the following table.

Correction factors based on liquid temperature t_l

t_l [°F]	80	90	100	110	120
Factor	1.10	1.05	1.00	0.95	0.90

Suction

(continued)

Hot gas defrosting

With hot gas defrosting, it is not normally possible to select a valve from condensing temperature t_c and evaporating temperature t_e .

This is because as a rule, the pressure in the evaporator quickly rises to a value near that of the condensing pressure. It remains at this value until the defrosting is finished.

In most cases, the valve will be selected from condensing temperature t_c and pressure drop Δp across the valve, as shown in the example for heat recovery.

Heat recovery

The following is given:

- Refrigerant = R22/R407C
- Evaporating temperature $t_e = 86^\circ\text{F}$
- Condensing temperature $t_c = 104^\circ\text{F}$
- Hot gas temperature ahead of valve $t_h = 185^\circ\text{F}$
- Heat recovery condenser yield $Q_h = 8\text{ kW}$

The capacity table for R22/R407C with $t_c = 104^\circ\text{F}$ gives the capacity for an EVR 10 as 8.9 kW, when pressure drop Δp is 2.9 psi.

The required capacity is calculated as:

$$Q_{\text{table}} = f_{\text{evaporator}} \times f_{\text{hot_temperature}} \times Q_h$$

The correction factor for $t_e = 86^\circ\text{F}$ is given in the table as 0.95.

The correction for hot gas temperature $t_h = 185^\circ\text{F}$ has been calculated as 4% which corresponds to a factor of 1.04.

Q_h must be corrected with factors found:

With $\Delta p = 2.9\text{ psi}$

is $Q_h = 8.71 \times 0.95 \times 1.04 = 8.6\text{ kW}$.

With $\Delta p = 1.4\text{ psi}$, Q_h becomes only $6.19 \times 0.95 \times 1.04 = 6.1\text{ kW}$.

An EVR 6 would also be able to give the required capacity, but with Δp at approximately 14.5 psi, the EVR 6 is therefore too small.

The EVR 15 is so large that it is doubtful whether the necessary Δp of approximately 1.4 psia could be obtained.

An EVR 15 would therefore be too large.

Result: An EVR 10 is the correct valve for the given conditions.

**Extended capacity
Hot gas**
Correction factors

The table values refer to hot gas capacity and are given as a function of condensing temperature t_c and pressure drop Δp across the valve.

Capacities are based on:
Hot gas temperature = $t_c + 40^\circ\text{F}$
Subcooling = 10°F
Evaporating temperature = 40°F
Superheat = 0°F

For each additional 10°F of superheat above 40°F , the table capacities must be reduced by 1%.

When the valve is used in a hot gas defrost circuit, evaporator temperature affects the capacity. When the evaporator temperature differs from 40°F , adjust the table capacities by multiplying them by the appropriate correction factor found in the following table.

Metric conversions

1 psi = 0.07 bar
 $\frac{5}{9}(t_1^\circ\text{F} - 32) = t_2^\circ\text{C}$
1 TR = 3.5 kW

Type	Pressure drop across valve Δp [psi]	Hot gas capacity Q _h [TR], Evaporating temp. t _e = 40 °F, Hot gas temp. t _h =t _c +40 °F, Subcooling Δt _{sub} = 10 °F

Extended capacity Hot gas

Correction factors

The table values refer to hot gas capacity and are given as a function of condensing temperature t_c and pressure drop Δp across the valve.

Capacities are based on:
Hot gas temperature = $t_c + 40^\circ\text{F}$
Subcooling = 10°F
Evaporating temperature = 40°F
Superheat = 0°F

For each additional 10°F of superheat above 40°F , the table capacities must be reduced by 1%.

When the valve is used in a hot gas defrost circuit, evaporator temperature affects the capacity. When the evaporator temperature differs from 40°F , adjust the table capacities by multiplying them by the appropriate correction factor found in the following table.

Metric conversions

1 psi = 0.07 bar
 $\frac{5}{9}(t_1^\circ\text{F} - 32) = t_2^\circ\text{C}$
1 TR = 3.5 kW

Type	Pressure drop across valve Δp [psi]	Hot gas capacity Q _h [TR], Evaporating temp. t _e = 40 °F, Hot gas temp. t _h =t _c +40 °F, Subcooling Δt _{sub} = 10 °F

**Extended capacity
Hot gas**
Correction factors

The table values refer to hot gas capacity and are given as a function of condensing temperature t_c and pressure drop Δp across the valve.

Capacities are based on:
Hot gas temperature = $t_c + 40$ °F
Subcooling = 10 °F
Evaporating temperature = 40 °F
Superheat = 0 °F

For each additional 10 °F of superheat above 40 °F, the table capacities must be reduced by 1%.

When the valve is used in a hot gas defrost circuit, evaporator temperature affects the capacity. When the evaporator temperature differs from 40 °F, adjust the table capacities by multiplying them by the appropriate correction factor found in the following table.

Metric conversions

1 psi = 0.07 bar
 $\frac{5}{9}(t_1 - 32) = t_2$ °C
1 TR = 3.5 kW

Type	Pressure drop across valve Δp [psi]	Hot gas capacity Q _h [TR], Evaporating temp. t _e = 40 °F, Hot gas temp. t _h =t _c +40 °F, Subcooling Δt _{sub} = 10 °F

**Extended capacity
Hot gas**
Correction factors

The table values refer to hot gas capacity and are given as a function of condensing temperature t_c and pressure drop Δp across the valve.

Capacities are based on:
Hot gas temperature = $t_c + 40^\circ\text{F}$
Subcooling = 10°F
Evaporating temperature = 40°F
Superheat = 0°F

For each additional 10°F of superheat above 40°F , the table capacities must be reduced by 1%.

When the valve is used in a hot gas defrost circuit, evaporator temperature affects the capacity. When the evaporator temperature differs from 40°F , adjust the table capacities by multiplying them by the appropriate correction factor found in the following table.

Metric conversions

1 psi = 0.07 bar
 $\frac{5}{9}(t_1^\circ\text{F} - 32) = t_2^\circ\text{C}$
1 TR = 3.5 kW

Type	Pressure drop across valve Δp [psi]	Hot gas capacity Q _h [TR], Evaporating temp. t _e = 40 °F, Hot gas temp. t _h =t _c +40 °F, Subcooling Δt _{sub} = 10 °F

Correction factors

The table values refer to hot gas capacity and are given as a function of condensing temperature t_c and pressure drop Δp across the valve.

Capacities are based on:
Hot gas temperature = 140 °F
Subcooling = 10 °F
Evaporating temperature = 40 °F
Superheat = 0 °F

For each additional 10 °F of superheat above 40 °F, the table capacities must be reduced by 1%.

When the valve is used in a hot gas defrost circuit, evaporator temperature affects the capacity. When the evaporator temperature differs from 40 °F, adjust the table capacities by multiplying them by the appropriate correction factor found in the following table.

Metric conversions

1 psi = 0.07 bar
 $\frac{5}{9}(t_1 \text{ °F} - 32) = t_2 \text{ °C}$
1 TR = 3.5 kW

Factor	1.18	1.14	1.09	1.04	1	0.97

**Extended capacity
Hot gas**
Correction factors

The table values refer to hot gas capacity and are given as a function of condensing temperature t_c and pressure drop Δp across the valve.

Capacities are based on:
Hot gas temperature = 140 °F
Subcooling = 10 °F

Evaporating temperature = 40 °F

Superheat = 0 °F

For each additional 10 °F of superheat above 40 °F, the table capacities must be reduced by 1%.

When the valve is used in a hot gas defrost circuit, evaporator temperature affects the capacity. When the evaporator temperature differs from 40 °F, adjust the table capacities by multiplying them by the appropriate correction factor found in the following table.

Metric conversions

1 psi = 0.07 bar

$\frac{5}{9}(t_1 \text{ °F} - 32) = t_2 \text{ °C}$

1 TR = 3.5 kW

Factor	1.18	1.14	1.09	1.04	1	0.97

**Extended capacity
Hot gas**
Correction factors

The table values refer to hot gas capacity and are given as a function of condensing temperature t_c and pressure drop Δp across the valve.

Capacities are based on:
Hot gas temperature = 140 °F
Subcooling = 10 °F
Evaporating temperature = 40 °F
Superheat = 0 °F

For each additional 10 °F of superheat above 40 °F, the table capacities must be reduced by 1%.

When the valve is used in a hot gas defrost circuit, evaporator temperature affects the capacity. When the evaporator temperature differs from 40 °F, adjust the table capacities by multiplying them by the appropriate correction factor found in the following table.

Metric conversions

1 psi = 0.07 bar
 $\frac{5}{9}(t_1 - 32) = t_2$ °C
1 TR = 3.5 kW

Type	Condensing temperature t _c [°F]	Hot gas capacity Q _h [lb/min] at pressure drop across valve Δp [psi]
